Designated according to Article 29 of Regulation (EU) No 305/2011 and member of EOTA (European Organisation for Technical Assessment)

European Technical Assessment

ETA-15/0476 of 4 May 2021

English translation prepared by DIBt - Original version in German language

General Part

Technical Assessment Body issuing the European Technical Assessment:	Deutsches Institut für Bautechnik
Trade name of the construction product	TUF-S
Product family to which the construction product belongs	Fastener for the rear fixing of facade panels made of high-pressure decorative laminates (HPL) according to EN 438-7:2005
Manufacturer	SFS intec AG Rosenbergsaustraße 10 9435 HEERBRUGG SCHWEIZ
Manufacturing plant	Plants of SFS intec AG
This European Technical Assessment contains	17 pages including 4 annexes which form an integral part of this assessment
This European Technical Assessment is issued in accordance with Regulation (EU) No 305/2011, on the basis of	EAD 330030-00-0601, Edition 10/2018
This version replaces	ETA-15/0476 issued on 12 July 2017

The European Technical Assessment is issued by the Technical Assessment Body in its official language. Translations of this European Technical Assessment in other languages shall fully correspond to the original issued document and shall be identified as such.

Communication of this European Technical Assessment, including transmission by electronic means, shall be in full. However, partial reproduction may only be made with the written consent of the issuing Technical Assessment Body. Any partial reproduction shall be identified as such.

This European Technical Assessment may be withdrawn by the issuing Technical Assessment Body, in particular pursuant to information by the Commission in accordance with Article 25(3) of Regulation (EU) No 305/2011.

Specific Part

1 Technical description of the product

The TUF-S-6xL is special anchor made of stainless steel for fixing HPL-facade panels according to EN 438-7:2005 to metal substructures. The anchor consist of a mandrel made of carbon steel zinced and a stainless steel sleeve. The anchor is put in a drill hole and placed by pulling out the mandrel. The pull out of the mandrel widens the body of the sleeve and punches the thread of the sleeve into the façade panel.

The product description is given in Annex A. The material values, dimensions and tolerances of the components of the fastener not indicated in the annexes shall correspond to the values laid down in the technical documentation[1].

2 Specification of the intended use in accordance with the applicable European Assessment Document

The performances given in Section 3 are only valid if the fastener is used in compliance with the specifications and conditions given in Annex B.

The verifications and assessment methods on which this European Technical Assessment is based lead to the assumption of a working life of the fasteners of at least 50 years. The indications given on the working life cannot be interpreted as a guarantee given by the producer, but are to be regarded only as a means for choosing the right products in relation to the expected economically reasonable working life of the works.

3 Performance of the product and references to the methods used for its assessment

3.1 Mechanical resistance and stability (BWR 1)

Essential characteristic	Performance
Characteristic resistance to breakout or pull-out failure under tension load	See Annex C 1 and C 2
Characteristic resistance to breakout or pull-out failure under shear load	See Annex C 1 and C 2
Characteristic resistance to breakout or pull-out failure under combined tension and shear load	See Annex C 1 and C 2
Edge distance and spacing	See Annex C 1 and C 2
Durability	Corrosion Resistance Class (CRC) III in accordance with EN 1993-1-4:2015
Characteristic resistance to steel failure under tension and shear loads	See Annex C 2

3.2 Safety in case of fire (BWR 2)

Essential characteristic	Performance
Reaction to fire	Class A1

[1] The technical documentation comprises all information of the holder of this ETA necessary for the production, installation and maintenance of the fastener; these are in particular design drawings. The part to be treated confidentially is deposited with Deutsches Institut für Bautechnik and, as far as this is relevant to the tasks of the approved bodies involved in the procedure of attestation of conformity, shall be handed over to the approved body.

4 Assessment and verification of constancy of performance (AVCP) system applied, with reference to its legal base

In accordance with EAD No. 330030-00-0601 the applicable European legal act is: [97/161/EG].
The system to be applied is: 2+

5 Technical details necessary for the implementation of the AVCP system, as provided for in the applicable European Assessment Document

Technical details necessary for the implementation of the AVCP system are laid down in the control plan deposited with Deutsches Institut für Bautechnik.

Issued in Berlin on 4 May 2021 by Deutsches Institut für Bautechnik

Product description
System components

Annex A 2

Specifications of intended use

Anchorages subject to

- Static and quasi-static loads

Base material

- The HPL façade panels shall be classified “EDS” or “EDF” according to EN 438-6:2014
- The minimum requirements for the façade panels are documented in the following table

Table 2: Minimum requirements for the façade panel

Characteristic values for the facade panel	Thickness of the panel	h ≥	[mm]	8
	Bending stress [1]	$\sigma_{fm,T}$ [2]	N/mm²	≥ 100
		$\sigma_{fm,L}$ [2]		≥ 130
	Bending modulus	E_T [3]	N/mm²	10000
		E_L [3]		14000
	Maximum mass increase according to EN 438-2:2016-06, section 15 (Resistance to wet conditions)	δ_w	[%]	2,00

1) σ_{fm} according to EN ISO 178:2013-09
2) $\sigma_{fm,T}$: Bending strength transverse
$\sigma_{fm,L}$: Bending strength longitudinal
3) E_T : Bending modulus transverse
E_L : Bending modulus longitudinal

Use conditions (Environmental conditions):

- According to EN 1993-1-4:2015 according to the Corrosion Resistance Class (CRC) of the fastener III

Design:

- The design of the façade panels and their fixing is carried out according to the conditions given in Annex D 1 and D 2.

TUF-S	Annex B 1
Intended use Specifications	

Installation

- Each façade panel shall be fixed technically strain-free with at least four anchors in a rectangular arrangement.
- The substructure is constructed such that the façade panels are fixed technically strain free via skids (loose bearings) and one fixed point (fixed bearing).
- The thickness of the fixing member (clamp or panel load-bearing profile) shall be at least 2,0 mm and shall be at least made of aluminum with $R_m \geq 215$ N/mm^2.
- The drillings are done at the factory or on site. The drillings are executed with special drill bits made available by SFS intec AG. The drillings are executed by skilled personnel.
- The façade panel is pre-drilled with diameter Ø 5,9 mm to 6,0 mm.
- The drilling is always in a 90°- angle to the panel's surface.
- The minimum edge distance of the drilling is 40,0 mm.
- The clamps are predrilled with diameter Ø 6,5 mm to 7,0 mm.
- The geometry of the drill hole shall be checked minimum on 1% of all drillings.
- The façade panels, their fixings as well as the substructure including its connection to wall brackets and their connection to the construction works are designed for the respective case of application under the responsibility of an engineer skilled in the field of façade construction.
- The panels are installed by skilled specialists and the laying instructions of the manufacturer shall be paid attention to.
- Overhead mounting is for façade panels of Trespa International B.V and Fundermax GmbH allowed.

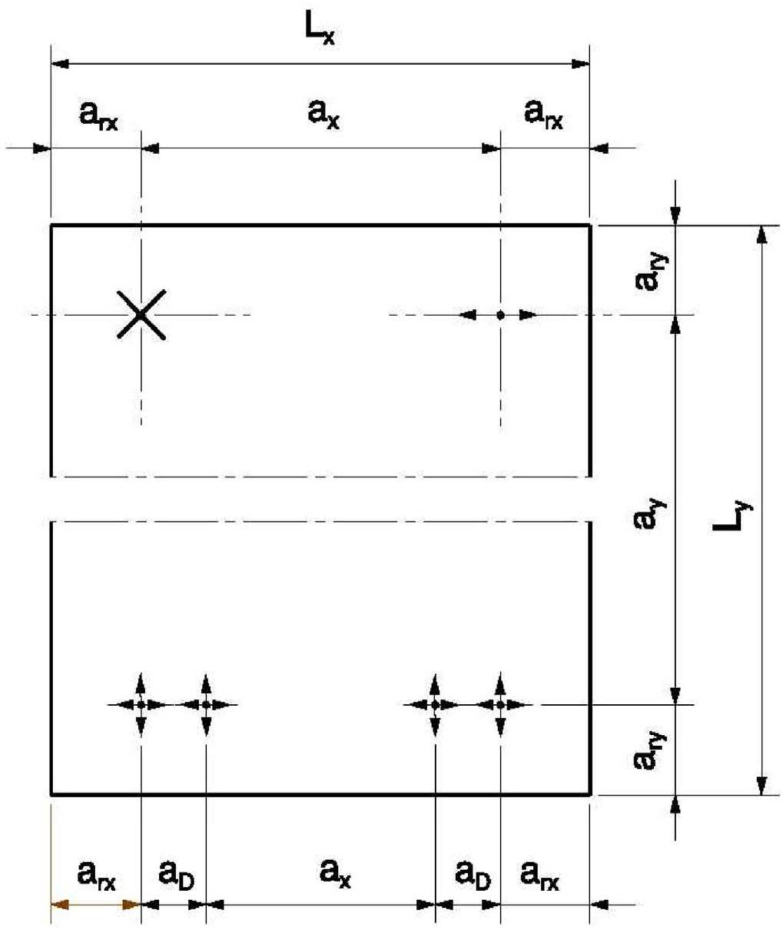
Definition of edge distance and spacing



Legend:

$a_{rx,y}$ = edge distance – distance of an anchor to the panel edge
$a_{x,y}$ = spacing between outer anchors in adjoining groups or between single anchors distance between anchors
a_D = spacing of anchors in an anchor group
L_x = greater length of the façade panel
L_y = smaller length of the façade panel
⨯ = fixed point (fixed bearing)
↔ = horizontal skid (loose bearing)
✛ = horizontal and vertical skid (loose bearing)

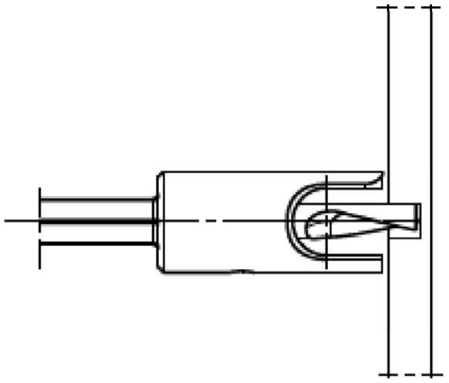
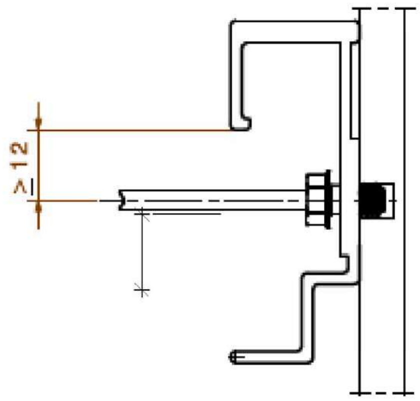
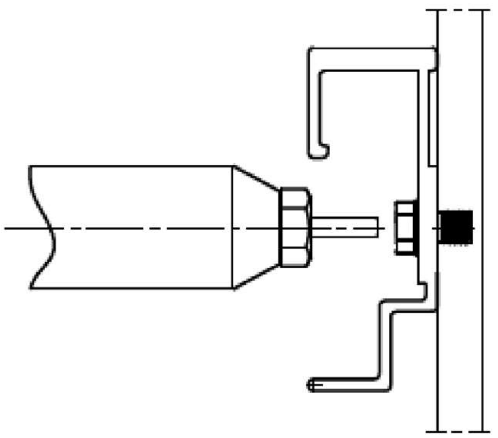
Installation instructions



Pilot drilling in the panel with the
6 mm dia. HSS drill bit with depth locator
or CNC machine



Position the pre-drilled bracket over the
hole in the panel and push through the TUF-S
blind fastener



Apply pressure with the rivet setting tool during the
setting process.
Remove the mandrel completely with the riveting
tool (GESIPA PowerBird, PowerBird Pro,
use nosepiece 17/36 or 17/40)

TUF-S	Annex B 7

	Spacing		a	[mm]	≥ 100						
	Value for tri-linear function with combined tension and shear load		X	[-]	1,0						

1) Values valid for bending angle of the façade panels ß ≤ 1,0° (Definition of ß see Annex D 1)
2) A minimum remaining panel thickness (panel thickness – setting depth) of 2,0 mm is required.
For intermediate values of the setting depth, linear interpolation is possible.
3) In absence of national regulations.

Table 7: Characteristic values of the anchor with double clamp (40,0 mm ≤ a_D < 100,0 mm)

Double clamp with 40,0 mm ≤ a_D < 100,0 mm												
Characteristic values for two anchors	Setting depth [2]			[mm]	5,0	5,5	6,0	6,5	7,0	7,5	8,0

Annex C 2

Design method

Loads

The design loads shall be calculated on basis of EN 1990:2010. The combination of loads shall be equal to EN 1990:2010. The loads shall be specified according to EN 1991-1-1:2010 to EN 1991-1-7:2010. Corresponding national regulations shall be taken into consideration. The unfavorable combination is decisive. Where necessary for the design of the anchor and the façade panel several combinations shall be analyzed separately.
The typical fundamental combination for façade panels considers loads from dead load $F_{Ek,G}$ (permanent loads) and wind $F_{Ek,w}$ (leading variable load)

According to EN 1990:2010 the following fundamental combination depending on the load direction results for a vertical façade panel:

Fundamental combination for loads parallel to the panel: $F_{Ed\parallel} = F_{Ek,G} \cdot \gamma_G$

Fundamental combination for loads perpendicular to the panel: $F_{Ed\perp} = F_{Ek,w} \cdot \gamma_Q$

mit $\gamma_G = 1{,}35$; $\gamma_Q = 1{,}50$

Resistance:

$N_{Rd} = \frac{N_{Rk}}{\gamma_M} \bullet \alpha_{F0} \bullet \alpha_{bend} \bullet \alpha_{wet} \bullet \alpha_{oh}$

$V_{Rd} = \frac{V_{Rk}}{\gamma_M} \bullet \alpha_{F0} \bullet \alpha_{wet}$

$\sigma_{Rd} = \frac{\sigma Rk}{\gamma_M}$

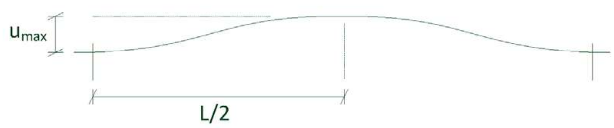
with:
N_{Rk} = characteristic tension resistance according to Annex C 1, Table 5 to 7
V_{Rk} = characteristic shear resistance according to Annex C 1, Table 5 to 7
σ_{Rk} = characteristing bending stress according to EN 438:2005
α_{F0} = If the façade panels do not meet the minimum requirements according to Annex B 1, Table 2, the characteristic values of load bearing capacity have to be multiplied additionally by α_{F0}:

$$\alpha_{F0} = min\left\{\frac{\sigma_{f,L,min}}{130\ N/mm^2}; \frac{E_{L,min}}{14000\ N/mm^2}; \frac{\sigma_{f,T,min}}{100\ N/mm^2}; \frac{E_{T,min}}{10000\ N/mm^2}; 1\right\}$$

α_{bend} = reduction factor of bearing of facade panel

The bending angle of the façade panel

$$ß = arctan\left(\frac{u_{max}}{L/2}\right)$$



$ß \leq 1{,}0°$ => $\alpha_{bend} = 1{,}0$
$1{,}0° < ß \leq 1{,}5°$ => $\alpha_{bend} = 0{,}89$
$1{,}5° < ß \leq 2{,}0°$ => $\alpha_{bend} = 0{,}80$

α_{wet} = If the façade panels do not meet the minimum requirements regarding the maximum mass increase of $\delta_w = 2.0\%$ according to Table 2, the characteristic values of load bearing capacity have to be multiplied additionally by $\alpha_{wet} = 0{,}78$.
α_{oh} = Overhead mounting, the characteristic tension resistance shall be reduced with 0,9

γ_M = 1,8

TUF-S	Annex D 1
Informativ Design method	

Verification

The calculation shall be carried out in a linear elastic manner. The stiffness of the substructure shall be considered for the respective case of application.

For the determined anchor loads it shall be verified, that the following equations are met.

Equation 1: $\frac{N_{Ed}}{N_{Rd}} \leq 1$

Equation 2: $\frac{V_{Ed}}{V_{Rd}} \leq 1$

Equation 3: $\frac{V_{Ed}}{V_{Rd}} + \frac{N_{Ed}}{N_{Rd}} \leq X$

with:

N_{Ed} = design value of the tensile force acting on the anchor

V_{Ed} = design value of the shear force acting on the anchor

N_{Rd} = design value of the tensile load bearing capacity of the anchor

V_{Rd} = design value of the shear load bearing capacity of the anchor

X = see Annex C 1

For the determined panel loads it shall be verified, that the following equation according is met:

Equation 4: $\frac{\sigma_{Ed}}{\sigma_{Rd}} \leq 1$

with:

σ_{Ed} = design value of the bending stress of the façade panel

σ_{Rd} = design value of the bending stress resistance of the façade panel

Verification to steel failure

$$\frac{N_{Ed}}{N_{Rd,s}} \leq 1,0$$

$$\frac{V_{Ed}}{V_{Rd,s}} \leq 1,0$$

$$\left(\frac{N_{Ed}}{N_{Rd,s}}\right)^2 + \left(\frac{V_{Ed}}{V_{Rd,s}}\right)^2 \leq 1,0$$

N_{Ed}: Design value of the tensile force

$N_{Rd,s}$: design value of steel failure under tension load

$N_{Rd,s} = N_{Rk,s} / \gamma_{Ms}$

$N_{Rk,s}$: Characteristic resistance to steel failure under tension

V_{Ed}: design value of the shear force

$V_{Rd,s}$: design value of steel failure under shear load

$V_{Rd,s} = V_{Rk,s} / \gamma_{Ms}$

$V_{Rk,s}$: Characteristic resistance to steel failure shear load

TUF-S	Annex D 2
Informativ Design method
